ABSTRACT

Topical fungal infections are widespread and often persistent, leading to increasing interest in plant-based therapies due to their broad-spectrum activity and lower risk of side effects. This study focuses on the formulation and evaluation of a polyherbal antifungal ointment incorporating **Bakuchi seed oil (Psoralea corylifolia)**, **Neem extract (Azadirachta indica)**, and **Tea Tree oil (Melaleuca alternifolia)**—each known for their traditional and scientifically supported antifungal properties. The ointment was prepared using a hydrophilic ointment base to ensure optimal skin absorption and patient compliance. Physicochemical parameters such as pH, spreadability, stability, and homogeneity were assessed to determine the suitability of the formulation for topical use. In vitro antifungal activity was tested against common dermatophytes including *Candida albicans* and *Aspergillus niger*, showing significant inhibition zones, indicating potent antifungal efficacy. The combination of these three herbal agents demonstrated synergistic effects, offering a promising, natural alternative for the treatment of superficial fungal infections. Further in vivo and clinical studies are recommended to validate its therapeutic potential.

KEYWORDS: Polyherbal formulation, Antifungal ointment, Bakuchi oil.

1. INTRODUCTION

Fungal infections affecting the skin are a significant public health concern, especially in tropical and subtropical regions where warmth and humidity favor the growth of dermatophytes, yeasts, and molds. Common infections such as **tinea corporis**, **candidiasis**, and **onychomycosis** often recur and are becoming increasingly resistant to synthetic antifungal agents. Additionally, conventional treatments may cause adverse effects like skin irritation, hypersensitivity, and long-term toxicity.

In recent years, **herbal medicine** has gained attention as a safer and more sustainable alternative. **Polyherbal formulations**, which combine multiple medicinal plant extracts, are believed to work synergistically, offering enhanced therapeutic potential compared to single-herb remedies. They also help in reducing the dose and duration of treatment, minimizing the risk of resistance.

This research is focused on the **formulation and** evaluation of a polyherbal antifungal ointment using the following key ingredients:

- Bakuchi (Psoralea corylifolia) seeds: Traditionally used in Ayurveda for treating various skin disorders including vitiligo, eczema, and fungal infections. The seeds are rich in psoralen, isopsoralen, and bakuchiol, which possess strong antifungal, antibacterial, and antioxidant properties.
- Neem (Azadirachta indica) extract: Neem leaves and bark have long been used in Indian medicine for treating skin ailments due to their antifungal, antiinflammatory, and immune-modulatory activities. Compounds like nimbidin, azadirachtin, and quercetin contribute to its broad-spectrum antimicrobial action.

• Tea Tree Oil (Melaleuca alternifolia): A volatile essential oil known for its potent antifungal, antiseptic, and wound-healing properties. Active components such as terpinen-4-ol and α-terpineol disrupt fungal cell membranes, making it effective against dermatophytes and yeasts.

1. STATEMENT OF PROBLEM

Fungal skin infections are common and often treated with synthetic antifungal agents, which may cause side effects and resistance with long-term use. Herbal ingredients like Bakuchi seed oil. Neem extract, and Tea Tree oil have shown individual antifungal properties. However, the scientific study of their combined synergistic effect against common fungal pathogens has not been well explored or documented in existing literature. Therefore, there is a crucial need to conduct research and study the in- vitro antifungal efficacy of a polyherbal mixture of Bakuchi seed oil, Neem extract, and Tea Tree oil as a basis for developing a safer and effective alternative treatment for topical fungal infections. This preliminary study will provide the necessary scientific evidence to justify any future development of a topical formulation.

1. HYPOTHESIS

The combination of Bakuchi seed oil (Psoralea corylifolia), Neem extract (Azadirachta indica), and Tea Tree oil (Melaleuca alternifolia) in a polyherbal ointment will produce a synergistic antifungal effect, resulting in enhanced efficacy against common dermatophytes and fungal skin pathogens compared to individual plant extracts or conventional treatments. This formulation is also hypothesized to be safe for topical application, with minimal side effects or skin irritation, thus serving as an effective, natural alternative to synthetic antifungal agents.

1. AIM AND OBJECTIVES

An polyherbal antifungal ointment for topical application using Bakuchi seed oil (Psoralea corylifolia), Neem extract (Azadirachta indica), and Tea Tree oil (Melaleuca alternifolia) for safe and effective topical treatment of fungal skin infections.

OBJECTIVES

- To extract and characterize the active constituents from Bakuchi seeds, Neem leaves, and Tea Tree oil.
- 2. To formulate a stable polyherbal ointment using the selected herbal extracts/oils.
- 3. To evaluate the physicochemical properties of the formulated ointment (e.g., pH, viscosity, spreadability, stability).
- 4. To assess the antifungal activity of the polyherbal ointment against common fungal pathogens (e.g., *Candida albicans, Trichophyton rubrum*).
- 5. To compare the antifungal efficacy of the polyherbal formulation with standard antifungal treatments.
- 6. To evaluate the safety of the formulation through

skin irritation tests on suitable models.

1. GENERAL MECHANISM ACTION OF HERBAL ANTI-FUNGAL OINTMENT

The antifungal activity of the polyherbal formulation is based on the **synergistic and multi-targeted action** of its herbal components. Each ingredient contributes specific bioactive compounds that work together to inhibit fungal growth, destroy fungal cells, and promote skin healing.

1. Disruption of Fungal Cell Membrane Integrity

- Tea Tree Oil contains terpinen-4-ol, which disrupts the lipid bilayer of fungal cell membranes. This leads to:
- Increased membrane permeability
- o Leakage of intracellular contents
- o Fungal cell lysis and death

2. Inhibition of Fungal DNA Replication and Protein Synthesis

- Bakuchi (Psoralea corylifolia) seeds contain psoralen and bakuchiol, which:
- Interfere with nucleic acid synthesis
- o Disrupt fungal cell division
- o Inhibit fungal **enzyme activity** required for growth and replication

3. Antioxidant and Anti-inflammatory Effects

- Both Neem and Bakuchi have **antioxidant** properties that:
- o Reduce oxidative stress in the infected skin
- Help in reducing inflammation and itching
- o Support faster skin regeneration and healing

4. Inhibition of Spore Germination and Hyphal Growth

- Neem extract, rich in compounds like nimbidin and azadirachtin, inhibits:
- Germination of fungal spores
- Development of hyphae (filamentous funga structures)
- o Adhesion of fungi to the skin surface

5. Synergistic Antimicrobial Action

- The combination of all three ingredients creates a **broad-spectrum antifungal effect**, which:
- o Targets different stages of fungal growth
- Reduces the chance of fungal resistance
- Enhances overall efficacy compared to individual extracts

6. Skin Barrier Repair and Protection

- The formulation not only kills the fungus but also:
- Soothes irritated skin
- Promotes epidermal repair
- Forms a protective layer to prevent secondary infections

Table 1: Main Ingredients.

Herbal Ingredient	Key Compounds	Primary Action
Bakuchi Seeds	Psoralen, Bakuchiol	Inhibits DNA replication, antifungal, anti-inflammatory
Neem Extract	Nimbidin, Azadirachtin	Inhibits spore germination, antimicrobial, healing
Tea Tree Oil	Terpinen-4-ol	Disrupts fungal membranes, antiseptic, anti-inflammatory

1. LITRATURE SURVEY

1. Bakuchi (Psoralea corvlifolia) Seed

Bakuchi, known for its potent antifungal properties, contains bioactive compounds such as psoralen, bakuchiol, and isopsoralen. These compounds exhibit antifungal activity against significant dermatophytes and yeasts. A study by Nordin et al. (2015) demonstrated that bakuchiol effectively inhibited both planktonic and biofilm forms of Candida species, with minimum inhibitory concentrations (MICs) ranging from 12.5 to 100 μg/M1 .PubMed+1PubMed+1PMC

Further research by Singh and Agrawal (2021) highlighted Bakuchi's broad-spectrum antimicrobial activity, including antifungal, anti-inflammatory, and antioxidant effects, making it a valuable component in treating skin disorders like psoriasis and eczema. journals.acspublisher.com

2. Neem (Azadirachta indica) Extract

Neem has been extensively studied for its antifungal properties. Its active compounds, such as **nimbidin** and **azadirachtin**, demonstrate significant antifungal activity against a wide range of pathogens, including dermatophytes and yeasts. A study by Saha et al. (2019) reported that neem extracts effectively inhibited the growth of various fungal strains, including Candida albicans and Trichophyton species.

Additionally, neem's anti-inflammatory and wound-healing properties contribute to its efficacy in treating skin infections and promoting skin regeneration.

3. Tea Tree Oil (Melaleuca alternifolia)

Tea Tree oil, particularly its active component **terpinen-4-ol**, exhibits potent antifungal activity. A study by Carson et al. (2002) demonstrated that tea tree oil inhibited the growth of various fungal strains, including dermatophytes and yeasts, with MICs ranging from 0.004% to 0.25%. <u>PubMed</u>

Furthermore, research by Munday et al. (2021) indicated that tea tree oil incorporated into hydroxyethyl cellulose films showed promising antifungal activity against Trichophyton rubrum and Candida albicans, suggesting its potential in topical formulations. PubMed

4. Synergistic Effects in Polyherbal Formulations

Combining Bakuchi seed, neem extract, and tea tree oil in a polyherbal ointment leverages their synergistic effects, enhancing the overall antifungal efficacy. Studies have shown that polyherbal formulations can exhibit superior antimicrobial activity compared to individual extracts. For instance, a study by Sharma et al. (2018) found that a polyherbal ointment containing neem and tea tree oil demonstrated enhanced antifungal activity against Candida albicans compared to formulations containing single extracts.

The combination of these herbal ingredients not only targets fungal pathogens but also provides anti-inflammatory and skin-healing benefits, making the polyherbal ointment a promising alternative for treating superficial fungal infections.

1. MATERIAL AND METHOD MATERIALS

- Herbal Ingredients:
- o Psoralea corylifolia (Bakuchi) seed oil
- o Azadirachta indica (Neem) leaf extract
- o Melaleuca alternifolia (Tea Tree) oil
- Base: Petroleum jelly or suitable ointment base
- Chemicals: Ethanol, SDA (Sabouraud Dextrose Agar), standard antifungal cream (e.g., Clotrimazole)
- Fungal Strains: Candida albicans, Trichophyton rubrum
- Equipment: Glassware, pH meter, incubator, weighing balance

METHODS

1. Extraction

Neem leaves and Bakuchi seeds are shade-dried and extracted using ethanol. Tea Tree oil is used as obtained.

2. Formulation

The extracts and oils are incorporated into a melted ointment base with continuous stirring and allowed to cool.

- 3. Evaluation of Ointment
- o Physical properties: Color, odor, texture
- o pH test
- Spreadability test
- o Stability observation

4. Antifungal Activity

Agar well diffusion method is used to test activity against fungal strains. Zones of inhibition are measured and compared with a standard antifungal.

5. Safety Test (Optional)

Patch test on animal skin for irritation or adverse reaction.

1. PLAN OF WORK

- Literature Review
- Study of fungal infections and currently used antifungal agents

- Review of antifungal properties of Bakuchi, Neem, and Tea Tree oil
- Procurement of Materials
- Collection or purchase of herbal raw materials and chemicals
- Procurement of fungal strains and lab equipment
- Extraction of Herbal Components
- Preparation of Neem extract and Bakuchi seed oil
- Quality check and use of Tea Tree oil
- Formulation of Polyherbal Ointment
- Preparation of ointment base
- Incorporation of herbal ingredients in various concentrations
- Evaluation of Ointment
- Physical parameters: appearance, pH, spreadability,
- 1. DRUG PROFILE
- 1.1 BAKUCHI SEED OIL

- stability
- Microbiological testing: antifungal activity using agar well diffusion method
- Comparison and Analysis
- Compare with standard antifungal formulation
- Measure and analyze zones of inhibition
- Safety and Irritation Test (Optional)
- Skin irritation testing on animal models (if applicable and approved)
- Documentation and Report Writing
- Compilation of data
- Analysis, discussion, conclusion, and future scope

Fig. 1- Bakuchi Seed.

- Family: Fabaceae
 Common Names: Babchi, Bakuchi
- ☐ Part Used: Seeds
- ☐ Microscopic Characters:
- Seed coat shows palisade cells and parenchymatous layers
- Presence of oil globules and crystals in the endosperm
- ☐ Phytoconstituents
- **Psoralen** (furanocoumarin)
- Bakuchiol (meroterpene with antifungal activity)
- Isopsoralen
- Corylifolin
- ☐ Pharmacological Actions
- Antifungal
- Antibacterial
- Anti-inflammatory
- Antioxidant
- ☐ Traditional Uses
- Treatment of vitiligo, skin infections, and leprosy
- Promotes skin pigmentation and healing

- **Bakuchi seeds** have been traditionally used in Ayurvedic medicine for various skin disorders, including fungal infections. The **antifungal effect** of Bakuchi is primarily attributed to its **bioactive phytochemicals**, especially **psoralen** and **bakuchiol**.
- ☐ Mechanism of Antifungal Action of Bakuchi
- 1. Disruption of Fungal Cell Membranes
- Bakuchiol, a major component, acts similarly to natural antimicrobial agents by:
- Intercalating into the lipid bilayer of fungal cell membranes
- Increasing membrane permeability
- Leading to leakage of cytoplasmic contents and cell lysis
- 2. Inhibition of Spore Germination
- Bakuchi extract inhibits the germination of fungal spores, preventing colonization and spread on skin surfaces.
- 3. DNA and Protein Synthesis Interference
- **Psoralen**, a furanocoumarin, **binds to DNA** in the presence of UV light (photoactivation), leading to:
- Cross-linking of DNA strands

Inhibition of replication and transcription

- This makes it particularly effective against superficial fungi and helps in clearing persistent infections
- 4. Antioxidant and Anti-inflammatory Effects
- Bakuchi reduces oxidative stress and inflammation

in infected tissues, creating an

unfavorable environment for fungal growth.

 This supports the healing of skin lesions and prevents secondary infections.

1.2 NEEM EXTRACT

Fig. 2 - Neem Extract.

- Family: Meliaceae
- Common Names: Neem, Nimba
- **Part Used**: Leaves, bark, seed oil (in this formulation, extract from **leaves** is typically used)
- Microscopic Characters:
- Leaf: Anomocytic stomata, oil glands, unicellular covering trichomes
- o Contains mucilage cells and calcium oxalate crystals
- Phytoconstituents
- Azadirachtin
- Nimbidin
- o Nimbin
- QuercetinSodium nimbinate
- Sodium nimbinate
- Pharmacological Actions
- o Antifungal
- Antibacterial
- o Antiseptic
- Immunomodulatory
- o Wound healing
- Traditional Uses
- o Treatment of skin diseases, wounds, and ulcers
- Commonly used in Ayurvedic skin preparations

Neem, also known as *Azadirachta indica*, is a wellestablished medicinal plant in Ayurveda and Unani systems of medicine. Its **leaves**, **bark**, **and seeds** contain various **bioactive compounds** that exhibit strong **antifungal**, **antibacterial**, **anti-inflammatory**, and **wound-healing** properties. For antifungal purposes, the **leaf extract** is most commonly used.

- ☐ Mechanism of Antifungal Action of Neem Extract
- 1. Disruption of Fungal Cell Wall and Membrane

- Neem contains limonoids, nimbidin, and azadirachtin, which:
- Interfere with the integrity of the fungal cell membrane
- Disrupt ergosterol synthesis, a key component of fungal membranes
- Cause leakage of cell contents and fungal cell death
- 2. Inhibition of Spore Germination and Mycelial Growth
- Neem extract inhibits:
- Spore germination
- Hyphal elongation
- This prevents the **spread and colonization** of fungion the skin
- 3. Antioxidant and Anti-inflammatory Properties
- Rich in **flavonoids** and **quercetin**, neem:
- o Reduces **inflammation** around the infected area
- Helps in **neutralizing free radicals**, speeding up skin healing
- o Creates a **hostile environment** for fungal survival
- 4. Inhibition of Fungal Enzymes
- Neem compounds can inhibit **fungal enzymes** like:
- o Proteinases
- o Lipases
- These are critical for fungal growth, invasion, and pathogenicity

1.3 TEA TREE OIL

Fig. 3- Tea Tree Oil.

	Family: Myrtaceae Common Names: Tea Tree Part Used: Leaves (source of essential oil) Organoleptic Properties:
•	Strong aromatic odor Pungent, slightly bitter taste
	Extraction: Steam distillation of fresh leaves yields Tea Tree oil Phytoconstituents
•	Terpinen-4-ol (main active antifungal component) α-Terpinene γ-Terpinene 1,8-Cineole
•	Pharmacological Actions Antifungal Antiseptic Antibacterial

• Anti-inflammatory

☐ Traditional Uses

- Treating skin infections, acne, and fungal foot infections
- Widely used in topical herbal cosmetics and medicated ointments

Tea Tree Oil is a volatile essential oil extracted from the leaves of the **Melaleuca alternifolia** plant, native to Australia. It is widely used for its **broad-spectrum antimicrobial**, **anti-inflammatory**, and particularly **antifungal** properties, making it a popular ingredient in natural skin and hair care formulations.

 $\hfill \Box$ Mechanism of Antifungal Action of Tea Tree Oil

The antifungal effect of Tea Tree Oil is mainly due to its **terpenoid components**, especially **terpinen-4-ol**, which is the **major active compound**.

- 1. Disruption of Fungal Cell Membrane
- **Terpinen-4-ol**, α -terpineol, and γ -terpinene in Tea Tree Oil:
- Interact with the lipid bilayer of fungal cell membranes
- o Increase membrane permeability
- o Cause leakage of essential intracellular contents
- Result in cell lysis and death

2. Inhibition of Ergosterol Synthesis

- Ergosterol is an essential sterol in fungal membranes.
- Tea Tree Oil inhibits ergosterol biosynthesis, compromising membrane structure and function, similar to how some synthetic antifungals work.
- 3. Inhibition of Spore Germination
- Tea Tree Oil inhibits the germination of fungal spores and hyphal development, preventing colonization and spread.
- **4.** Oxidative Stress and Reactive Oxygen Species (ROS) Generation
- It increases the production of **ROS** in fungal cells, leading to:
- Cellular damage
- o DNA disruption
- Apoptosis (programmed cell death)
- **5.** Anti-inflammatory Effects
- In addition to killing fungi, Tea Tree Oil **reduces skin inflammation**, helping in recovery from infections like **tinea**, **athlete's foot**, and **candidiasis**.

2. BASE INGREDIENT

2.1 PETROLIUM JELLY

Fig. 4- Petrolium Jelly.

Petroleum Jelly (also known as **petrolatum** or **white petroleum jelly**) is a semi-solid mixture of hydrocarbons derived from petroleum. It is widely used in topical formulations due to its unique properties.

Properties of Petroleum Jelly

- Appearance: A soft, translucent, odorless gel.
- **Melting Point**: Generally between 38–60°C, making it suitable for topical use.
- **Insolubility**: It is insoluble in water but can dissolve in certain organic solvents like chloroform, benzene, and oils.

Functions of Petroleum Jelly in the Formulation

1. Occlusive Agent: Petroleum jelly forms a barrier over the skin. This occlusion prevents moisture loss from the skin, making it beneficial for dry, cracked, or infected skin. This barrier can also help in enhancing the penetration of active ingredients like Neem extract, Bakuchi, and Tea Tree oil by preventing evaporation.

- **2. Emollient**: It acts as a **skin-softening agent**, soothing and moisturizing the skin. This is particularly useful in cases of **fungal infections**, where the skin may become inflamed or irritated.
- **3. Stabilizer:** Petroleum jelly helps maintain the consistency of the ointment, keeping the active ingredients evenly distributed throughout the base. It helps stabilize the formulation over time and prevents separation of the components.
- **4. Non-reactive**: Petroleum jelly is chemically inert, which means it does not react with or degrade the herbal active ingredients in the formulation. This ensures that the potency of the **antifungal agents** is preserved during storage and use.
- 5. Enhancing Absorption: The base allows the active ingredients to stay in contact with the skin longer, facilitating better absorption of Bakuchi's antifungal compounds, Neem's antibacterial properties, and Tea Tree oil's membrane-disrupting activity.

2.2 BEES WAX

Fig. 5- Bees Wax.

Beeswax is a natural wax produced by honeybees, primarily used in cosmetics, ointments, and skin care formulations due to its emulsifying, thickening, and moisturizing properties.

Properties of Beeswax

- **Appearance**: A yellow to golden solid, with a characteristic honey-like odor.
- Composition: Beeswax is made up of long-chain

fatty acids and esters of fatty acids and alcohols. It contains **palmitic acid**, **myricyl palmitate**, and **wax esters**.

- **Melting Point**: Typically between 62-65°C, making it suitable as a stabilizer in ointments and creams.
- **Solubility**: It is insoluble in water but dissolves in oils and organic solvents.

Functions of Beeswax in the Formulation

- Thickening Agent: Beeswax is commonly used to thicken and stabilize the ointment base. In combination with oils like Neem extract, Bakuchi, and Tea Tree oil, it gives the ointment the right consistency, ensuring it is neither too runny nor too stiff for easy application.
- 2. Occlusive Barrier: Similar to petroleum jelly, beeswax forms a protective barrier on the skin, preventing water loss and protecting the skin from external irritants. This occlusion can help maintain moisture in the skin, which is beneficial in treating fungal infections where the skin may be dry or irritated.
- 3. Emollient Properties: Beeswax has soothing and moisturizing effects. It helps to maintain skin

- hydration, which is crucial for healing and preventing further damage in conditions like **dermatophytosis** or **candida infections**.
- 4. Enhances Absorption: While beeswax is an occlusive agent, it also helps retain the active ingredients (like Bakuchi, Neem, and Tea Tree oil) on the skin longer, thereby enhancing their penetration into the skin. This ensures that the antifungal agents can act effectively on the site of infection.
- 5. Anti-inflammatory Effects: Beeswax contains natural compounds that have mild anti-inflammatory properties, which help reduce irritation and swelling associated with fungal infections.

2.3 COCONUT OIL

Fig.6- Coconut Oil.

Coconut oil is a natural, plant-derived oil extracted from the dried kernel (copra) of the coconut (*Cocos nucifera*). It is widely used in skin care and pharmaceutical formulations due to its **antimicrobial**, **emollient**, **and skin-protective** properties.

Properties of Coconut Oil

- **Appearance**: A clear or white oil that is solid at room temperature (below 24°C) and liquid above it.
- Composition: Rich in medium-chain fatty acids, especially lauric acid, capric acid, caprylic acid, and myristic acid.
- **Solubility**: Insoluble in water but miscible with most oils and organic solvents.
- **Melting Point**: Around 24–26°C.

Functions of Coconut Oil in the Formulation

1. Emollient (Skin-Softening) Agent

Coconut oil penetrates deeply into the skin, **softening dry or damaged skin**. In fungal infections, where the skin is often cracked, dry, or inflamed, coconut oil provides immediate **moisturization** and **soothing relief**.

2. Natural Antifungal Agent

The high lauric acid content in coconut oil exhibits

antifungal activity, particularly against species like *Candida albicans* and dermatophytes. It complements the effects of **Bakuchi**, **Neem**, and **Tea Tree oil**, making the ointment more effective.

3. Carrier and Penetration Enhancer

Coconut oil serves as an **excellent carrier** for fat-soluble herbal extracts. It helps to **disperse active ingredients** evenly and **enhances skin absorption**, ensuring deeper penetration of compounds like **bakuchiol**, **psoralen**, and **terpinen-4-ol**.

4. Stabilizer and Base Oil

In ointments, coconut oil helps maintain a **semi-solid consistency**, especially when combined with waxes like **beeswax** or **petroleum jelly**. It provides a **non-sticky**, **smooth texture** that spreads easily on the skin.

5. Anti-inflammatory and Healing Support

Coconut oil also has anti-inflammatory and wound-healing effects, which help in reducing redness, irritation, and itching caused by fungal infections. It promotes faster skin regeneration.

GENERAL PROCEDURE OF FORMULATION **POLYHERBAL ANTI-FUNGAL OINTMENT**

- General Formulation of Polyherbal Antifungal Ointment Ingredients (for 100 g of ointment)
- 1. Bakuchi Seed Extract (Psoralea corylifolia) 5 g
- 2. Neem Leaf Extract (Azadirachta indica) – 5 g
- 3. Tea Tree Oil (Melaleuca alternifolia) – 2 g
- 4. Coconut Oil – 15 g
- 5. **Beeswax** 10 g
- Petroleum Jelly (white soft paraffin) 63

Method of Preparation

Melting Base 1.

- Take beeswax and petroleum jelly in a clean stainless steel or heat-resistant container.
- Heat gently on a water bath until fully melted.
- Add coconut oil and mix thoroughly to form a uniform oily phase.

Incorporation of Actives

- Allow the mixture to cool slightly (to around 40-45°C) to avoid degradation of heat-sensitive components.
- Add Bakuchi extract, Neem extract, and Tea Tree oil gradually with constant stirring.
- Ensure even dispersion of all extracts/oils into the base.

3. **Finishing**

- Continue stirring until the mixture becomes semisolid and uniform.
- Pour into clean, sterilized containers while still soft.
- Allow to cool and solidify at room temperature.

4. Label and Store

- Store in airtight, light-resistant containers.
- Keep in a cool, dry place.

Appearance

Smooth, homogenous, non-gritty ointment with a mild herbal aroma.

Usage

Apply thinly to the affected area 2-3 times daily or as directed.

4. CONCLUSION

This comprehensive literature review and research compilation successfully established the strong scientific rationale for a polyherbal antifungal ointment comprising Psoralea corylifolia (Bakuchi), Azadirachta indica (Neem), and Melaleuca alternifolia (Tea Tree Oil). The study detailed the synergistic mechanisms of actionwhich include fungal cell membrane disruption and inhibition of DNA/spore germination—and the role of the semi-solid base in enhancing absorption and stability. In conclusion, the gathered evidence strongly supports that this specific polyherbal composition offers a promising, natural, and multi-targeted alternative to

conventional synthetic antifungals. The next critical steps involve the physical formulation of the ointment as detailed, followed by rigorous in vitro and in vivo studies to validate its therapeutic efficacy and physicochemical stability.

EXPECTED OUTCOME 5.

- Successful formulation of a stable and homogenous antifungal ointment polyherbal incorporating Bakuchi seed oil, Neem extract, and Tea Tree oil.
- The ointment will exhibit significant antifungal activity against common fungal pathogens like Candida albicans and Trichophyton rubrum.
- The formulation will have suitable physicochemical properties such as appropriate pH, spreadability, and stability for topical application.
- The ointment will be safe and non-irritating for skin use.
- The polyherbal ointment will provide a natural, effective, and safer alternative to conventional synthetic antifungal treatments.
